

## North Houston Terminal: A Customer-Oriented Facility

To better meet customer needs, the North Houston Terminal of ExxonMobil Pipeline Company (EMPCo) has installed a new Generic Additive System that enhances its capability to serve customers of non-ExxonMobil brands.

The Generic Additive System is fully computerized. With its pre-program function, the desired additive type, as well as the quantity, is precisely injected in motor gasoline products. The system possesses high reliability, which keeps both terminal operations and customers satisfied.

"The success of this project is an outcome of good teamwork among EMPCo and our ExxonMobil affiliated businesses. We will continue to explore opportunities to improve the efficiency and effectiveness of our operations," said B. J. Young, EMPCo Central South Area Manager.

The North Houston Terminal is located on the north side of the Houston Metro area near Interstate Highway 45. This new system enables the terminal to accommodate an additional throughput of 3,000 barrels per day for customers in the Woodlands, Conroe, and the area north of Sam Houston Tollway.
